Equine Sports Medicine Seminar for COCHA

TOPICS:

- Lameness in the Western Performance Horse—Treatment Options for Specific Problems (IRAP, Stem Cell, joint injections)
- How the Lameness Locator System Works and Can Help

DEMONSTRATION:

- Lameness Locator In Action

What is the Equinosis Lameness Locator? It is a computerized system developed by Dr. Keegan of Missouri State University College of Veterinary Medicine that allows evaluation with motion sensing devices during soundness exams.

Three sensors transmit wirelessly to a tablet computer that uses software to translate this info into a quantitative value for the severity of lameness, and which limb(s) are affected. Readings are taken at more than 200x/second, 10-20x as good as the best human eye. It is very helpful for subtle or multi-limb problems, and for assessing the effect of therapies or nerve/joint blocks. More info is available at www.equinosis.com. We are pleased to be the first veterinary practice in Oregon to offer this new technology to our clients.
